

70 years of historical brain life cell therapy for PD, and thank God it is not created from Aborted human fetus!

By Jeffrey J. Harsh PHD

When I was on the board of directors of the National Health Federation, the President was a great elegant lady named Maureen Solomon. She started a clinic in Tijuana, Mexico, that imported different live cells from Germany. When I went down to have a treatment, the only problem I had was getting a motel with my wrinkle face Shar-Pei dog. Needless to say, the cells changed our lives. Six months later I saw and felt the results of a younger body and I have been using them ever since. As the cells in the different organs in our body age, they divide and die by autolysis. Each time this atrophy happens, the new replacement cells lose information and that equals ageing. Reprogramming the DNA with young unadulterated cells, causally reverses aging. The cells are taken from neonatal unborn animals, to prevent the patient from autolysis. By using cells from neonatal unborn animals, the historical moral line of aborted human baby cells is not crossed. The FDA has not approved the injection of live cells, so all we can do here in the USA is take live cells orally. A patient can bypass stomach acid destruction through endonasal eyedropper or spray.

Because of my exposure to herbicides, mostly through GMO foods that absorbed the herbicides while growing in the plant stage, I contracted Parkinson's. What has really helped my cognitive ability, memory and speech is super live cell brain from celllifeamerica.com. I administer this with an eyedropper. With my head tilted back I squirt cells up the nasal pathway. It can burn some, but with a width of camphor it goes through the brain barrier. For the best price, ask for the PD special.

Here is information and history on cell therapy from their website.

Available for the past 70 years in Europe, porcine Embryonic Organo Supplementation (EOS) is now available in the form of embryonic cellular preparations, making it possible, and affordable, to receive the incredible benefits of EOS without traveling to expensive European

Clinics.

Cell Life USA's EOS uses similar principals as those used in cell therapy, however, instead of extracting whole intact cells, EOS starts with the selection of specific organ tissue from an organic porcine embryo and through proprietary technology, it is processed into a bio-available form of a nutritional supplement. Many years of experience have demonstrated that porcine are the best donor animals for humans because they are vital, hardy animals and immunologically, their bodies are the closest match to the human body. Due to this fact, many heart valve transplants for humans are still derived from porcine. In addition, porcine cellular supplements are particularly compatible with the human body, and in the embryonic stage, there is a very low degree of immunogenicity, or possible allergic reaction, as they are typically not recognized as foreign antigens by the host body. According to Dr. Niehan's, known as the Father of Cell Therapy, when ingested into the human body, "like goes to like"; bone to bone, liver to liver, heart to heart, etc., where they only fit into the receptor sites of the target organ and begin to support the function of that specific target organ.

Cell Life USA's EOS preparations are derived from specific embryonic organ cell tissues and are ideally suited to support anti-aging and health maintenance. They are for oral use only and can often perform little miracles in supporting body structure and body function.

Cell Life USA's cellular supplements, which are organ specific, are not species specific and are formulated to "educate" human organs to function at a more youthful level. The organ itself then, can retain its structure and function for an extended period of time.

In addition to body re-building, health maintenance, and anti-aging, EOS is designed to stimulate the structure and function of cells of specific organ systems to help the overall health of the body or can be used with specific intent, such as, to help enhance structure and or function of immune system, memory and cognitive function, sexual function, specific organ function, endocrine function, skin elasticity, senile ocular conditions, or improve muscle, joint and bone health, just to name a few.

EOS is also formulated to help support and enhance structure and function as it relates to aerobic capacity, sports performance, fertility, energy, and vitality.

Dr. Niehans stated the ultimate aim of cell therapy in this way: ***"What I am striving for, is not only to give more years to life, but especially, to give more life to years."***

Niehan's aim was to ***"make all the organs struck by old age capable once more of functioning properly."***
